

## Software Release Note for Step1

### AT Version V533C

Update 01/07/02

## Beta lite GPRS release – Not fully validated -

### Features

➔ This version is lock-enabled. **SEE NOTE**

(You have to use a locked module to use this software and check that you have not changed the sim or network lock)

➔ R99 EPLMN with a few operator-requested enhancements now full featured (AT commands to modify lists of PLMN are now available)

➔ Concatenated SMS

➔ E-ONS

➔ Enhanced cell re-selection algorithm for mobility

### NOTE FOR THE LOCK :

A module must **NOT** be upgraded with this version if:

- the module had a SIM-lock or network-lock enabled when running a non-GPRS firmware (needs a special tool to perform that)
- **AND** afterwards that module had been upgraded with any GPRS firmware earlier than 533c

In that case the module cannot be upgraded unless the lock is restored (can only be done at factory).

**Caveat: failure to observe their restrictions results in the module refusing to start up.**

### Missing Features

➔ MF5-no support for EMx modes

➔ MF8-no support for LLC Ack mode

➔ MF9-no support for RLC UnAck mode

### Corrected problems (CP) / Changes in the AT command interface (CAT)

☑ CP1- CSD/fax call fixed

☑ CP2- Entering "0.0.0.0" as an IP address when defining a context (to request dynamic IP) may result in failure to open a session. Problem fixed.

☑ CP3- Improvement of the module consumption in the 2D hardware

☑ CP4- Correction of the mono-band bug (900Mhz only)

☑ CP5- Call forwarding problem fixed

☑ CP6-

**Known bugs**

KB1 – Reset of the module when the SMS-CB is activated. To avoid that, do not activate this feature

KB2 –
